

# PRINTABLE CELESTIAL NAVIGATION WORK FORMS

For detailed instructions and numerical examples, see the companion booklet listed below.

- FORM 104 — All bodies, using Pub 249 or Pub 229
- FORM 106 — All Bodies, Using NAO Tables
- FORM 108 — All Bodies, Almanac, and NAO Tables
- FORM 109 — Solar Index Correction
- FORM 107 — Latitude at LAN
- FORM 110 — Latitude by Polaris
- FORM 117 — Lat, Lon at LAN plus Polaris
- FORM 111 — Pub 249, Vol. 1 Selected Stars

## **Other Starpath publications on Celestial Navigation**

- Celestial Navigation*
- Starpath Celestial Navigation Work Forms*
- Hawaii by Sextant*
- How to Use Plastic Sextants*
- The Star Finder Book*
- GPS Backup with a Mark 3 Sextant*
- Emergency Navigation*
- Stark Tables for Clearing the Lunar Distance*
- Long Term Almanac 2000 to 2050*

**Form 104, All Sights, Pub. 249 or Pub. 229**

**Form 117, Short Forms for LAN and *Polaris* Sights**

Lat at LAN			
Find Ho		degrees	minutes
Hs-max =			
IC (+Off, - On) =	±		
Dip (from HE) =	-		
Ha =			
alt corr (UL-,LL+) =	±		
Ho =			
Find z (90°-Ho)		89°	60.0'
Ho =	-		
z =			
DR (Lat, Lon) =			
<i>Lat = sum or difference Dec and z</i>			
Dec or z =			
z or Dec =	±		
Lat =			

Date	hr	min	sec
UTC LAN =			

Declination in Nautical Almanac at UTC of LAN				
		degrees	minutes	d-value (±)
Dec (hr) =	N S			
d corr =	±			
Dec =	N S			

Lon at LAN = GHA sun at UTC of LAN				
		degrees	minutes	
GHA (hr) =				
GHA (m.s) =	+			
GHA =				
<i>If GHA between 0 and 180, Lon W = GHA</i>				
<i>If GHA between 180 and 360, Lon E = 360-GHA</i>				

**LAN Lat Rules:** For Contrary Name:  $Lat = z - Dec$ . For Same Name:  $DR-Lat > Dec$ ,  $Lat = z + Dec$ ;  $DR-Lat < Dec$ ,  $Lat = Dec - z$ . But don't forget the easy rule: add them, and if that is nonsense (compared to your DR Lat) then sub-tract them. **LAN Lon Reminder:** LAN Lon is only as accurate as the UTC you assign to the event. The Lon will be uncertain by 15' for each 1 minute of time uncertainty in your choice of peak Hs time.

Find LHA $\Upsilon$			
UTC <i>Polaris</i> sight	hr	min	sec

*This form covers 12 sights.*

**Form 107, for Latitude at LAN**

<b>Step 1 Correct Hs to get Ho</b>			
1-1	Record Maximum Sextant Height (Hs = peak height of the sun at noon), and mark limb	Lower Upper Hs	° ' "
1-2	Record Index Correction (mark sign + if off, - if on)	IC	Off On + -
1-3	Record eye height (HE) and Look up Dip Correction on the right-hand side of Table A2, front of the Almanac (correction depends on HE)	Dip HE (ft)	-
1-4	Sum the above three numbers to get Apparent Height	Ha	° ' "
1-5	Look up altitude correction on lefthand side of Table A2, front of the Almanac (correction depends on Ha, Limb, and month) (mark sign + for lower limb, - for upper limb)	Alt corr.	+ -
1-6	Sum the above two numbers to get Observed Height	Ho	° ' "

<b>Step 2 Determine the Zenith Distance</b>			89°	60.0'
2-1	Record Ho from Step 1, above, and then subtract it from 90° to get the zenith distance	Ho	-	° ' "
2-2	Zenith distance	z		° ' "

<b>Step 3 Use the Almanac to Find Sun's Declination</b>		GMT date =		
3-1	Record the date and GMT of the sight (the time the sun reached its peak height)	GMT (hr) =	GMT (min) =	
3-2	Turn to the daily page of the Almanac for the date of the sight, and find the sun's declination (dec) for the hour of the sight (line 3-1) and record it here.	Dec (hr)	N S	° ' "
3-3	Record the d-value from the bottom of the dec column in the Almanac. Mark the signs of the d-value and d-corr + if the dec for the next hour is larger, or - if it is smaller.	d-value = +-	d-corr = +-	' "
3-4	Turn to the Increments and Corrections pages at the back of the Almanac (T-9 to 12, in the notes) and find the minutes table for the GMT minutes (line 3-1). On the right-hand side of the double line in the table, find the d-corr corresponding to the d-value of line 3-3.	Declination =	N S	° ' "
		3-5 Apply the d-corr to the dec(hr) and record it above.		

**Step 4 Find Latitude from Zenith Distance and Declination**

Record DR Latitude to use as a guide, and then take the sum or difference of zenith distance and declination to find your true Latitude at LAN.

Declination or Zenith distance	°	'	"
Zenith distance or Declination	°	'	"
Latitude =	°	'	"

**Form 110, for *Polaris* Sights**

Step 1. Correct Hs to get Ho				
1-1	Record Sextant Height of <i>Polaris</i>	Hs	°	'
1-2	Record Index Correction <i>"If it's off, put it on; if it's on, take it off."</i>		Off + On -	'
1-3	Record height of eye (HE=____) and look up Dip Correction on the right-hand side of Table A2, front of Almanac		Dip -	'
1-4	Sum the above to get the Apparent Height of <i>Polaris</i>	Ha	°	'
1-5	Look up the Altitude Correction (always minus)	alt corr.	-	'
1-6	Sum the above two numbers to get Observed Height	Ho	°	'

Step 2. Find LHA Aries (∇)		UTC Date =		
2-1	UTC Time in Hours, Minutes and Seconds	UTC Time =		
2-2	Find GHA ∇ on left-hand side of daily pages of the Nautical Almanac	GHA ∇ (hr) =	°	'
2-3	Find GHA Aries minutes and seconds correction from Increments and Corrections pages	GHA ∇ (m, s) =	°	'
2-4	Sum the above two numbers to get GHA Aries	GHA ∇ =	°	'
	<i>Extra spaces to adjust angles as needed</i>			
2-5	DR Lon: -West; +East	-W, +E	°	'
2-6	Combine 2-4 and 2-5 to get LHA ∇	LHA ∇ =	°	'

Step 3. Latitude Determination				
3-1	Ho from 1-6	Ho	°	'
3-2	Subtract 1°		-1 °	
3-3	Add a0 from <i>Polaris</i> Table (using LHA Aries)	+a0	°	'
3-4	Add a1 from <i>Polaris</i> Table (using DR Latitude)	+a1		'
3-5	Add a2 from <i>Polaris</i> Table (using Month)	+a2		'
3-6	Sum the above to find Latitude	Latitude =	°	'
<i>Note that this procedure for finding Lat from <i>Polaris</i> is explained in the Nautical Almanac.</i>
